Foreword

One of the main activities listed in ASPAC's original *Membership Information and Objectives Brochure* in 1990 was to "conduct regular National Quality Assurance Programs to enhance standards of the analysis and assist standardisation of soil and plant analytical methods across laboratories". For the next dozen years, soil and plant Interlaboratory quality assurance programs of ASPAC operated at around 12 to 18 month intervals with only minor changes. Members of ASPAC's Laboratory Proficiency Committee overviewed these programs and discussed them nationally and internationally.

As part of a continuous improvement process that included a comprehensive written review, the ASPAC Executive agreed in 2002-03 that its interlaboratory proficiency programs should be upgraded to increase their frequency and the number of samples assessed annually. As a consequence, ASPAC went to international tender to locate and appoint a service provider able to meet ASPAC's needs at a fair price to participants.

This annual report is the first public exposure of ASPAC's upgraded inter-laboratory proficiency program (ILPP) for plant chemical tests. It covers three "rounds" each of four homogeneous samples sent to 36 participants in August and December 2004 and in April 2005. A similar program for soils, reported separately, commenced in June 2004.

Members of ASPACs Laboratory Proficiency Committee, the membership of which is listed on page iv of this report, oversaw the program. The ASPAC Executive is grateful to all of those who contributed to the report, inclusive of staff of Proficiency Services Limited, our new service provider in New Zealand.

The ASPAC Executive also appreciates the effort and commitment made by participating laboratories. By participating they share a commitment to and responsibility for measurement quality.

Vlad Kawaljenko
Chairperson of ASPAC 2004-2006

Acknowledgements

All periods of transition have their challenges and the upgrading of ASPAC's ILPPs was no exception. Participating laboratories across Australasia are commended for their patience and loyal support.

We thank the staff of Victoria's DPI-Werribee (previously known as the State Chemistry Laboratory), particularly Bruce Shelley, Pat Johnstone and Kathryn Parker, for their assistance in helping with the preparation and transfer of ASPAC test samples from Victoria, Australia, to Hamilton, New Zealand.

In New Zealand we thank LandCare Research and Hill Laboratories, respectively, for the sample homogeneity testing they undertook for PSL. And within PSL, we extend thanks to Joanne Bedford, other PSL staff and to Dr Philip Poole for their inputs.

YOUR NOTES

1. Introduction

The Australasian Soil and Plant Analysis Council Inc (ASPAC) commenced its not-for-profit ILPPs and issued its first soil program report in 1993. Its ILPPs specifically target soil and plant chemical laboratories in the Australasian region, although there are no restrictions on who can participate. A service provider operates the programs for ASPAC under contract.

ILPPs support ASPAC's overall goals to:

- promote excellence in all aspects of soil and plant analysis
- encourage and promote the adoption of preferred methods and protocols used in soil and plant analysis within Australasia.

More details on ASPAC can be obtained from its public web site at www.aspac-australia.com. The site includes ASPAC's Strategic Plan and the names of its elected and appointed office holders.

Published ASPAC plant ILPP reports are dated 1994, 1996, 1998, 1999, 2000, 2001, and 2002. All were conducted and reported through an Australian provider as discrete entities, based on six homogeneous samples of dried and ground plant materials and subsequent laboratory analysis for a comprehensive range of plant chemical tests, mostly for total elements.

This is the first annual report from ASPAC's new, upgraded plant ILPP that commenced in 2004 and now operates out of New Zealand through Proficiency Services Limited (PSL). The program is a composite of three "rounds", each of four homogeneous samples of dried and ground plant materials. Laboratory participants (Appendix 1) receive individual progress reports of their results (relative to other participating laboratories) for each of these "rounds". They also receive from the service provider a consolidated, individual annual summary report on their measurement performance relative to others.

This annual program report consolidates (for ASPAC members and the public record) the three "rounds" that occurred in August 2004, December 2004 and April 2005. It also records program methodology, summary statistics, and a listing of "raw" data by test for the three "rounds". In addition, the report includes an outline of how ASPAC periodically confers performance-based, method-specific certification to laboratories that regularly participate. To respect confidentiality, the cross-reference between laboratory name and laboratory identification number is not included. However, ASPAC's public web site now lists the laboratories certified as proficient for specific tests for the most recently completed program year. ASPAC's plan is to update information on certified tests and certifications for participating laboratories soon after completion of each annual program for both plants and soils.

2. Program Details

2.1 Responsibilities

Proficiency Services Ltd, was contracted by ASPAC as the plant ILPP provider for 2004-05. Accordingly, PSL had responsibility on a "round-by round" basis for sourcing and preparation of samples and for the timely supply of samples to participating laboratories. They also undertook data collation and statistical analysis and "round-by-round" reporting for ASPAC and assembled the summary and "raw" data provided in Section 3 and Appendix 4, respectively. PSL is a proficiency service provider accredited to *ISO Guide 43-1 Part 1: "Development and operation of proficiency testing schemes"*.

ASPAC's Laboratory Proficiency Committee (LPC; see Page iv) had responsibility to implement and resolve matters of policy and to provide guidance on technical matters specific to soil and plant chemical testing both to PSL and to laboratory participants. LPC also undertook statistical checks and audits for quality control purposes, participated in a Technical Advisory Group operated by PSL, and contributed to training workshops. ASPAC, through members of its LPC or via its state representatives, may contact managers of laboratories with poor analytical performance to ensure a measurement improvement program is commenced. Laboratories are encouraged to seek help from ASPAC if they are shown to be operating at levels of measurement performance below their peers.

Participants receive a unique, confidential laboratory number, subsequently used to identify the origin of each result presented in program reports and lists of results. Typically, this identification number carries forward from one annual program to the next.

2.2 Plant program participation

A total of 36 laboratories arranged to participate in the ASPAC plant ILPP in 2004-05 but the numbers that reported results varied by "round" and plant test (see Table 1). The most commonly reported tests with an average of 28 laboratories across the three "rounds" were phosphorus (P), calcium (Ca) and magnesium (Mg). The least frequently reported tests were silicon (Si), selenium (Se) and lead (Pb), with averages of 4, 9 and 11 laboratories, respectively. The precise counts for each test and sample are given in Section 3.

Contact details for laboratories that submitted results for any test in one or more of the three rounds are provided in Appendix 1.

2.3 Tests and methods

Three proficiency "rounds" for plant materials – each comprising four samples – were offered for the 2004-05 program. Participants were invited to analyse each sample using methods normally employed in their laboratory. The number of tests was limited to 21 as listed in Table 1, noting that participants were not obliged or required to submit results for all tests. Only Si was reported by less than six laboratories. In order to permit a meaningful statistical analysis, a minimum of 6 participating laboratories is required for any one test.

Table 1. Plant tests (total elements), elemental symbols, units and the arithmetic average number of results per round submitted by participating laboratories in the ASPAC 2004-05 plant ILPP

2004-05 Plant tests	Symbol	Units	Number of participants		
			August 04	Dec. 04	April 05
Aluminum	Al	mg/kg	19	16	21
Boron	B	mg/kg	25	24	25
Cadmium	Cd	mg/kg	15	10	13
Calcium	Ca	%	29	26	28
Carbon	C	%	14	10	11
Chloride	Cl	% ^A	14	17	17
Cobalt	Co	mg/kg	15	13	13

2004-05 Plant tests	Symbol	Units	Number of participants		
			August 04	Dec. 04	April 05
Copper	Cu	mg/kg	28	26	26
Iron	Fe	mg/kg	27	26	27
Lead	Pb	mg/kg	15	7	10
Magnesium	Mg	%	29	26	28
Manganese	Mn	mg/kg	27	26	28
Molybdenum	Mo	mg/kg	18	14	14
Nitrogen	N	%	28	25	29
Phosphorus	P	%	29	26	28
Potassium	K	%	28	26	28
Selenium	Se	mg/kg	12	7	9
Silicon	Si	%	5	4	3
Sodium	Na	%	26	26	27
Sulfur	S	%	25	24	25
Zinc	Zn	mg/kg	28	26	28

A Units of mg/kg are preferred for concentrations < 0.01%

All of the listed tests were understood to be total concentrations in the plant material and reported on or around a 65°C oven dry basis, not on an “as received” basis. Details of analytical methods used are not included but known to include methods such as Kjeldahl digestion, other forms of acid digestion, XRF, and near-infrared spectroscopy, with measurement by continuous flow, ICP-AES, ICP-MS, atomic absorption and the like.

2.4 Sample preparation and identification

Victoria’s DPI-Werribee prepared the bulk samples of plant material used in 2004-05. These samples were oven dried at 65°C, ground, mixed, and sub-sampled into approximately 100g portions. Subsequently, bulk samples in the required quantity were re-mixed and sub-sampled into 20g portions by PSL.

Before distribution to participants, potential samples were assessed for homogeneity. Specifically, 10 containers of each sample were selected at random from the sub-sampled batch according to the principles described by Thompson and Wood (1993)¹. These sub-samples were then tested in duplicate for plant total N. Additional tests, including total Zn, total C and total P, were undertaken but not on all samples. The tests were conducted in laboratories accredited to ISO 17025.

Results from the homogeneity testing were subsequently statistically assessed according to ISO REMCO Protocol N231 "Harmonised Proficiency Testing Protocol" of January 1992. Variations between samples were such that all sample batches were considered to meet homogeneity criteria suited to proficiency testing. Examples of the homogeneity data and statistical assessments are summarised in Appendix 2.

¹ Thompson, M and Wood, R. (1993). International harmonized protocol for proficiency testing of (chemical) analytical laboratories. *Journal of AOAC International* 76 (4), 926 – 940.

In addition to testing for homogeneity, the plant samples were irradiated or otherwise rendered biologically benign to comply with international and/or national biosecurity regulations or requirements².

Ultimately, the samples used in the three “rounds” of the 2004-05 program were distributed and coded as follows: round 204 of August 2004 — ASP 81-84; round 404 of December 2004 — ASP 121-124; and round 604 of April 2005 — ASP 41-44. The association between sample code and sample type is provided in Table 2.

Table 2. Sample identification numbers and sample types included in the ASPAC 2004-05 plant ILPP

Sample ID	Sample type
ASP 81	Wheat grain
ASP 82	Hay
ASP 83	Pine needles
ASP 84	Dry potato tuber
ASP 121	Pasture
ASP 122	Cabbage leaf
ASP 123	Wheat
ASP 124	Eucalyptus leaf
ASP 41	Lucerne hay
ASP 42	Wheat grain
ASP 43	Eucalyptus leaf
ASP 44	Dry potato tuber

2.5 Data analysis and periodic reporting

Laboratory results, after submission to PSL, were entered into a database and independently checked for data transfer accuracy prior to data processing. The non-parametric assessment of laboratory performance for each sample and method was performed by an iterative statistical procedure similar to that used in WEPAL interlaboratory proficiency programs of Wageningen University. This procedure³⁴⁵⁶ is suited to datasets of as few as six laboratories, although larger laboratory populations are best. An outline of the “median / MAD” statistical procedure is provided in Appendix 3, with terms described in Table 3. In addition to medians and MADs, other statistical parameters (also described in Table 3) were calculated before and following the omission of non-conforming results. The “raw” data submitted by participating laboratories on a test-by-test basis are documented in Appendix 4, sometimes after rounding only for table formatting purposes.

Table 3. Statistical terms and their meanings in the context of this ASPAC annual report

<i>Statistical term</i>	<i>Meaning and/or derivation</i>
Count or number	Original population size.
Maximum 1	The highest of a range of values, based on the initial data set.
Minimum 1	The lowest of a range of values, based on the initial data set.
Median	The median is the score at the 50 th percentile. It is the score or potential score in a distribution of scores, above which and below which one-half of the frequencies fall. It is the middle observation of a sequentially sorted array of numbers, except in the case of an even sample size. Here it is the arithmetic mean of the two observations in the middle of the sorted array of observations. The median of a reasonably sized array of numbers is insensitive to extreme scores.
Mean ^A	The arithmetic mean (or average) is the sum of the values of a variable divided by their number. It represents the point in a distribution of measurements about which the summed deviations equals zero. The arithmetic mean is sensitive to extreme measurements.
MAD	The <u>Median</u> of the <u>Absolute Deviations</u> , calculated as the median of the absolute values of the observations minus their median.
Interquartile range (IQR)	This is calculated by subtracting the score at the 25 th percentile (referred to as the first quartile; Q ₁) from the score at the 75 th percentile (the third quartile; Q ₃). This value is affected by the assumptions made in the calculation of the first and third quartiles, particularly for low population sizes. Moreover, these differences exist within and across statistical software packages. Prior to the 2004-05 rounds, ASPAC used the algorithm employed by EXCEL and some others. For the 2004-05 program, the algorithm employed was that of SAS Method 4 ⁷ . In summary, IQR = Q ₃ -Q ₁ .
Normalized IQR	This equates to IQR x 0.7413, where the latter is a normalizing factor.
Robust % CV ⁸	The robust coefficient of variation (Robust % CV) = (100 x normalised IQR / median). For simplicity, the Robust %CV shown is for the initial results, and for "final" population of results for a test after the removal of "outliers" and perhaps "stragglers", usually following one or two iterations.
Integer 1 and the letter "f" associated with medians, means, MADs, IQR and Robust %CVs in data summaries.	The integer "1" relates to the initial data set. The letter "f" relates to the "final" data set, generated after one or two iterations typically after removal of laboratories with statistical "outliers" (if any), and perhaps statistical "stragglers" (if any).

A When the mean is greater than the median, the distribution is positively skewed. When the mean is lower than the median, the distribution is negatively skewed.

⁷ SAS Procedure Guide.

⁸ "Guide to NATA Proficiency Testing". 27 pp. (National Association of Testing Authorities, Australia, December 1997).

It is noteworthy that results submitted by each laboratory were expected to have three significant figures, unless protocol or common sense dictated otherwise. For example, the program accepted data where it was common to report measured concentrations to the nearest second decimal point, such as 0.01 mg/kg or 0.01 %, rather than to three significant figures. However, the program (like others nationally and internationally) did not accept as a numeric value, a result reported as less than (<) or greater than (>) a specified number. In cases where the expected value was below the laboratory's lower limit of reporting, the expectation was that the laboratory would report a value half way between that value and zero. For high values, dilution was the expected option. In practice, this did not always occur in 2004-05, witnessed by the inclusion of a few zero values in the "raw" data compilations in Appendix 4.

Interim "round" reports, summarizing measurement performance relative to the performance of all laboratories in the program that undertook the same test/s, were routinely and quickly emailed to laboratory participants. The main purpose of these interim reports was to provide timely feedback and to enable laboratories to take prompt remedial action where appropriate. Interim reports also provided an opportunity to correct for any data-transfer and data-processing misinterpretations. In addition, a Newsletter from the service provider went to all participating laboratories. Its main purpose was to assist in the interpretation of the Interim Report. Also included in the Newsletter was information about upcoming events and operational administration of the program.

Laboratories that participated in the 2004-05 plant ILPP all received from PSL (on behalf of ASPAC) a laboratory specific, confidential, annual summary report. Each laboratory's data for the 12 plant samples, the aggregate data from all participants, other relevant statistical data, and whether or not the test/s received ASPAC Certification (if applicable), were provided. The laboratory code number was included.

2.6 ASPAC upgraded criteria for certification of laboratories for plant tests

Subject to satisfactory measurement performance for twelve samples across three sequential "rounds", typically over a twelve-month period, ASPAC awards participating laboratories with a printed, signed and dated *Certificate of Proficiency*. The *Certificate of Proficiency* identifies performance for each test that met criteria set by ASPAC. Certification applies when a laboratory incurs no more than four demerit points for the twelve samples.

Demerit points (if any) were allocated through the identification of "outliers" and "stragglers" by the "median / MAD" statistical procedure mentioned earlier in this report. Two demerit points were allocated to each statistical "outlier", while a statistical "straggler" was allocated one demerit point. As no sample result could be both an "outlier" and a "straggler", a maximum of two demerit points is all that could accrue per sample for a specific test.

For any single "round" of four samples, three (3) was set as the maximum number of demerit points for a specific test. This was done so that unsatisfactory measurement for a test in one "round" did not in itself result in failure to be certified for that test across the three "rounds" in the designated 12-month period.

If a "round" was missed, the maximum number of three demerit points for every test in that "round" was allocated, unless very special circumstances applied and was known or advised expeditiously to ASPAC's LPC through its Convenor. When the explanation was accepted, performance from the three most recently completed "rounds" was used to assess eligibility for certification.

Year 2004-05 was a special case as it was the inaugural year of ASPAC's enhanced ILPP and also the inaugural year for application of ASPAC's new demerit points / certification system. Since there was no "previous year", the laboratories who failed to report results on all three "rounds" in 2004-05 automatically accrued maximum demerit

points (3) for tests in each of the missed “rounds”. Laboratories that missed only one “round” remained eligible for ASPAC Certification, conditional on good performance in their other two completed “rounds”.

Finally, when less than six (6) laboratories submitted results for a particular test and/or sample, proficiency assessments could not be made statistically with an acceptable level of confidence and hence certification for the specific tests could not be granted.

It is noteworthy that ASPAC’s *Certificates of Proficiency* are only issued on completion of each annual program of three “rounds”. Nowadays, ASPAC provides details of certified laboratories by test on its public web site. Certifications obtained in the 2004-05 Plants’ program remained valid until the corresponding 2005-06 program was complete.

3. Summary Statistics

This section provides summary information and data (sometimes rounded only for table formatting purposes) on a test-by-test basis (alphabetical) for each of the 12 samples used across three “rounds” in 2004-05. The tabulations include values relevant to the iterative “median / MAD” procedure plus other robust statistics. The only test unable to be fully assessed because of low numbers was total Si. The meaning or derivation of the terms used in the tabulated summaries is provided in Table 3 and in Appendix 3. All data are expressed on a dry weight basis.

2004-05: Total Aluminum (mg/kg)

4. Comments on Measurement Performance

A detailed evaluation of measurement performance is beyond the scope of this report. Such evaluations are typically made at ASPAC Workshops and in other national and international fora. However, it is appropriate to make a few observations.

Firstly, the data summaries in Section 3 show many examples of skewed data; i.e. there were quite large differences at times between the median and mean values reported by laboratories. This emphasised the importance of using medians and MADs, which are less influenced by ‘rogue’ results in small data sets.

Secondly, the grand median robust % CVs across the 12 samples, after the removal of “outliers” and “stragglers”, ranged from 5.2 to 92.8%. This covered the 20 tests reported by a minimum of six laboratories (Si was excluded on this criterion). Table 4 provides the identity of the six best and six worst tests, with their corresponding robust % CVs. There were some “round-by-round” fluctuations in measurement performance by test, but always total C had lowest robust %CVs and Pb the highest.

Thirdly, the median robust CV across the 20 tests on a sample by sample basis ranged from 8.5% (ASP121) to 15.1% (APS81), with a grand median for the 12 samples of 9.8%. Based on the similarity of these CVs, no sample was outstandingly more difficult than others to analyse.

Table 4. The six best performed and worst performed plant chemical tests, based on grand median percent robust coefficients of variation after the removal of “outliers” and “stragglers”.

Best (Lowest Robust %CVs)		Worst (Highest Robust %CVs)	
Plant test	%CV	Plant test	%CV
Carbon	5.2	Boron	16.8
Magnesium	6.2	Cadmium	18.9
Phosphorus	6.3	Selenium	29.2
Nitrogen	7.0	Aluminum	29.4
Potassium	7.7	Cobalt	40.3
Calcium	8.1	Lead	92.8

Finally, as an unannounced check on measurement performance over time, three of the samples were offered in more than one “round”. Specifically, two samples in the August 2004 “round” were re-offered in April 2005, while one sample from the December 2004 “round” was re-offered in April 2005. Based on geometric means of median results after removal of “outliers” and following data transformation to reflect the proximity of each paired test result to unity, the two “round one” and “round three” geometric mean pairs (expressed as percentages) of the population of tests were each within 1.5 percentage points of each other. However, the “round two” and “round three” comparison was approximately 4.0 percentage points different (“round three values were lower on average”), particularly for Pb.

Appendix 1: List of laboratories who participated in ASPAC's Plant ILPP in 2004-05

Mr Ted Mikhail (Managing Director)
SWEP Pty Ltd Analytical Laboratories
PO Box 583
Noble Park VIC 3174
AUSTRALIA
Email: tmswep@connexus.net.au

Dr Robert Patterson (Director)
Lanfax Laboratories
PO Box W 90
ARMIDALE
NSW 2350

* The estimate of SD for variation between samples within these batches is imprecise due to the magnitude of variation in test repeatability. In all cases, the total variation (from both repeatability and sample variation) is significantly less than the variation in proficiency results – ie. sample batches are fit for use in interlaboratory comparisons.

Appendix 3: Statistical procedures used by ASPAC for its upgraded Plant ILPP

Refer to Table 3 for a description of most statistical terms and their meaning. Of most significance is the “median / MAD” non-parametric, iterative procedure for identifying “outliers” (††) and “stragglers” (†) within datasets for particular tests and samples from multiple (typically 6 or greater) laboratories. See references in the body of the report for more details. Also, the median (μ) is regarded as a good estimate of the true mean, while the MAD; ie. the median of the absolute deviations from the median, (@), is regarded as a good estimate of the standard deviation.

After tabulating the data with a separate column for each sample result and a separate row for each laboratory, calculations were applied iteratively. Each iteration operated at an action level of $[(X - \mu)/f@]$ (called the “ASPAC Score” for convenience) > 2 , where “X” is the value reported by the laboratory (one replicate assumed), “ μ ” is the median of the population of values, and “f@” is a code for the Gaussian distribution of the sample size “n”, approximated by $(0.7722 + 1.604/n * t)$, with t = the Student’s “t” for 2.5% (two-tailed) with $n-1$ degrees of freedom. Excluding any case when a laboratory reported no result (or a non-numeric value), the laboratories at first iteration with an “ASPAC score” > 2 were rated as “outliers” (††).

Following their removal (if any), the remaining population of laboratory data was subject to a second iteration involving a recalculation of the “ASPAC score”. Where this was again > 2 , the relevant laboratories were rated as “stragglers” (†).

Further iterations can be undertaken if the sample is targeted for upgrading to the status of a reference, only to converge the mean and the median, thereby providing a more likely “correct” reference result.

The other statistics summarised in Table 3 were calculated on the same populations of data. However, only the first (1) and second (final; f) values appear in the data summaries in Section 3.

Appendix 4: “Raw” program data for the 12 samples across three “rounds”.

These tabulations list, in alphabetical order, the "raw" data provided by participating laboratories for each method, with unnecessary precision removed after completion of statistical tests only to assist data presentation. Statistical "outliers" and "stragglers" are indicated by †† and †, respectively. All results are on an oven dry basis.
