Foreword

This annual report is the tenth in the upgraded inter-laboratory proficiency program (ILPP) for plant chemical tests, the first of which occurred in 2004-2005 report. It covers three “rounds” each of four specially prepared samples sent to around 39 participants in October 2012, in February 2013 and in April 2013. A similar annual program for soils (reported separately) operated over much the same time period.

The members of ASPAC's LPC, listed on page iv of this report, oversaw the program. The ASPAC Executive is grateful to all of those who contributed to the report, inclusive of staff of Global Proficiency Ltd (GPL), our service provider.

The ASPAC-LPC and the ASPAC Executive Committee also appreciates the effort made by laboratories who utilized the method-specific proficiency program. By participating, they share a commitment to and responsibility for measurement quality, noting that measurement proficiency is only a component of laboratory accreditation to ISO-IEC 17025 standard, which should be an achievement goal for laboratory managers.

Dr Roger Hill
ASPAC-LPC Convenor

Acknowledgements

Mr Lyndon Palmer (South Australia) is thanked for helping to identify and quantify random Co, Cu and occasionally Fe contamination in circulated plant samples. We also thank Mr Alan Jeffrey (Queensland) and staff at Hill Laboratories (New Zealand) for their analytical efforts to help discover occasional plant sample contamination during preparative stages. Those commissioned by GPL to confirm that test plant samples were homogenous prior to circulation for proficiency testing purposes (e.g., DSITI, Queensland Australia) are also acknowledged, as are operational staff of GPL.

Notes on ASPAC Method-specific Certification: *what it is and what it is not*

In common with almost all soil, plant and water ILPPs worldwide, this plant ILPP used a selection of carefully prepared samples to allow participating laboratories to test and compare their method-by-method measurement performance relative to those of their peers across Australasia. The process is method-specific, as each method (or elemental test) is assessed separately using internationally-respected non-parametric statistics. Obviously, the peer review process is strongest for methods/tests with most participants, always ≥ 7 and typically well in excess of that number. Regular feedback with “round-by round” regularity provides tangible evidence to guide laboratory managers in their efforts towards measurement excellence.

Subsequently, a published numeric process was used on a method/test basis and on each of three “rounds” of four samples in the program year to determine whether or not a given laboratory qualified to be ASPAC Certified for that test. For the program year covered by this report, 22 was the maximum number of possible certifications per laboratory. The ASPAC Certifications achieved remained current until superseded by findings from the next corresponding ILPP.

Irrespective of method-measurement quality, it remains the responsibility of laboratory management to pay close attention to total quality management. This involves attention to performance in inter-laboratory proficiency programs while also taking account of variables such as technical competence and procedures, sample preparation, records of corrective actions, customer complaints, instrumental accuracy checks and maintenance, staff training / qualifications, standard-solution preparations, method validation / verification, internal audits, batch quality control, reports to clients, etc. Laboratory accreditation to ISO-IEC 17025 standard covers all of these. The National Association of Testing Authorities (NATA) is responsible for laboratory accreditation and compliance in Australia.

Field sampling, the transport of samples to the laboratory, and the interpretation of test results for clients are other areas that affect the final outcome of soil and plant chemical testing for diagnostic purposes. For helpful guidelines on these topics, refer to publications by Brown (1994)¹, Peverill *et al.* (1999)², Rayment (2006)³ and Reuter and Robinson (1997)⁴. The following “poster”, prepared by ASPAC, was designed for within-laboratory use.

1. Introduction

This not-for-profit, annual report for 2013-14 consolidates (for ASPAC members and for the public record) program methodology, summary statistics, and a full listing of results by test for three “rounds” of plant chemical testing. For historical details on earlier annual ILPPs for both plant and soil samples undertaken by ASPAC, refer to the ASPAC Web Site at <http://www.aspac-australasia.com>.

The report includes a description of how ASPAC confers performance-based, method-specific certification to laboratories that participated throughout the program year. To respect confidentiality, the cross-reference between laboratory name and laboratory identification number is not included. However, laboratories certified as proficient for specific tests included in this annual program were documented at the time on ASPAC’s public web site mentioned above.

2. Program Details

2.1 Responsibilities

GPL was contracted by ASPAC as the plant ILPP provider for 2013-14. Accordingly, GPL had responsibility on a “round-by round” basis for sourcing and preparing samples and for the timely supply of prepared samples to participating laboratories. They also undertook data collation and statistical analysis and “round-by-round” reporting for ASPAC. In addition, they assembled the contents of the summary and “raw” data tabulations provided in Section 3 and Appendix 4 of this report.

Members of ASPAC-LPC had responsibility to implement and resolve matters of policy and to provide guidance on technical matters specific to plant chemical testing both to GPL and to laboratory participants. The ASPAC-LPC also undertook statistical checks and other actions for quality control purposes, participated in a Technical Advisory Group operated jointly with GPL, and contributed to training workshops. Laboratory managers and staff of those who contributed to this annual program are encouraged to seek help from ASPAC if they are shown to be operating at levels of measurement performance below their peers. Appropriate contacts are members of the ASPAC-LPC and/or State representatives of ASPAC (or equivalent).

Participants receive a unique, confidential laboratory number, subsequently used to identify the origin of each result presented in program reports and listings of results. Typically, this identification number carries forward from one annual program to the next.

2.2 Plant program participation

Some 39 laboratories [27 from Australia, 2 from Fiji, 8 from New Zealand, 1 from Papua New Guinea] participated in the ASPAC plant ILPP in 2013-14, but numbers of reported results varied by “round” and plant test (see Table 1). The counts for each test element and sample are given in Table 1 and in Section 3. Contact details for laboratories that submitted results for any test in one or more of the three “rounds” are provided in Appendix 1.

2.3 Tests, units, laboratory participation and concentration ranges

Three proficiency “rounds” for plant materials – each comprising four samples – were offered in 2013-14. Participants were invited to analyse each sample using methods normally employed in their laboratory. Tests commonly performed are documented in Table 1, noting that participant numbers for each element and “round” are also listed. Laboratories were not required to submit results for every one of these tests, although a minimum of seven participating laboratories per “round” were required for any one test to permit meaningful statistical analyses. In addition, Table 1 includes concentration ranges (minimum, median, maximum) for each element across the 12 samples, noting that those

concentration ranges derive from “final” populations after removal of “stragglers” and “outliers”. For 20 of the 22 plant tests, the population average concentration for a given element was greater than corresponding median (average values not presented), while for the other 2 tests (N, P) the average was less than the median. Moreover, 16 grand median concentrations were lower than their 2012-13 counterparts, one was much the same, and five were higher, suggesting final robust %CVs might be slightly higher for this program year than occurred in 2012-13.

Table 1. Plant tests, elemental symbols, units, the arithmetic average numbers of results per round submitted by participating laboratories in the ASPAC 2013-14 Plant ILPP, plus the concentration ranges and the final grand median concentration for all 22 tests.

2013-14 Plant tests	Symbol	Units	Number of participants			Concentration ranges (final) by test across 12 samples, as reported by labs		
			Oct 13	Feb 14	May 14	Minimum	Median	Maximum
Aluminium	Al	mg/kg	21	21	23	1.1	103	1270
Boron	B	mg/kg	31	29	28	0.732	21.3	184
Cadmium	Cd	µg/kg	13	11	13	2.05	34.9	1570
Calcium	Ca	%	37	33	34	0.006	0.85	2.35
Carbon	C	%	23	22	19	37.2	43.4	51.1
Chloride	Cl	mg/kg	23	23	21	400	5080	36200
Cobalt	Co	µg/kg	19	15	17	2.92	107	615
Copper	Cu	mg/kg	36	32	33	1.44	8.32	26.6
Iron	Fe	mg/kg	36	32	33	17.3	105	482
Lead	Pb	µg/kg	12	11	11	12.8	104	451
Magnesium	Mg	%	36	33	34	0.082	0.226	1.08
Manganese	Mn	mg/kg	36	32	33	3.72	66.8	1970
Molybdenum	Mo	µg/kg	20	16	16	60.4	267	732
Nitrate-N	NO ₃ -N	mg/kg	14	13	14	0.907	17.1	2850
Nitrogen	N	%	35	33	31	1.19	2.74	4.68
Phosphorus	P	%	37	32	33	0.12	0.234	0.467
Potassium	K	%	33	33	34	0.381	1.58	6.69
Selenium	Se	mg/kg	15	13	13	12	39.9	110
Silicon	Si	%	7	6	6	0.004	0.049	1.84
Sodium	Na	%	35	31	31	0.001	0.105	2.34
Sulfur	S	%	32	29	29	0.085	0.184	0.59
Zinc	Zn	mg/kg	36	32	32	11.8	25.4	93.4

All but one of the tests in Table 1 were assumed to be total concentrations in the plant material. The assumption is that all results were reported on a 65°C oven-dry basis, not on an “as received” basis. However, some results reported as “totals”, such as Al and Si, may only reflect acid digestible concentrations.

Details of analytical methods used are not described in detail in this report. Method-indicating codes, however, are summarized in Tables 5 and 6 of Appendix 4, while relevant Codes are included with the “raw-data” tabulations in Appendix 4.

2.4 Sample preparation and identification

Before distribution to participants, potential samples were assessed for homogeneity. Specifically, 10 containers of each sample were selected at random from the sub-sampled batch, according to the principles described by Thompson and Wood (1993)⁵. These sub-samples were then tested in duplicate for plant total N, using Dumas combustion. The tests were conducted in one laboratory that was accredited to ISO 17025 standard. Several of the samples were also checked for the accidental presence of trace heavy metal contaminants, as earlier mentioned.

Results from homogeneity testing were subsequently statistically assessed according to ISO REMCO Protocol N231 “Harmonised Proficiency Testing Protocol” of January 1992. Variations between samples were such that all sample batches other than ASP 22 were considered to meet homogeneity criteria suited to proficiency testing. Examples of the homogeneity data and statistical assessments are summarised in Appendix 2. The homogeneity “problem” with test sample ASP 22 involved questionable data for Sample 1, Reps 1 and 2.

In addition to testing for homogeneity, the plant samples were irradiated or otherwise rendered biologically benign to comply with international and/or national biosecurity regulations or requirements⁶.

Ultimately, the samples used in the three “rounds” of the 2013-14 program were distributed and coded as follows: October 2013 – ASP 101-104; February 2014 – ASP 21-24; and May 2014 – ASP 51-54. The association between sample code and sample type is provided in Table 2. Nine of the 12 test plant samples were sourced from New Zealand and the other three came from Australia.

Table 2. Sample identification and the origin of the samples included in the 2013-14 ASPAC plant ILPP.

Sample ID	Round ID	Sample Type	Origin
ASP 101	113	Vetch Hay	Australia
ASP 102		Maize Flour	New Zealand
ASP 103		Olive Leaves	New Zealand
ASP 104		Spinach Leaves Midribs Removed	New Zealand
ASP 21	313	Carrot Foliage	New Zealand
ASP 22		Magnolia Leaves	New Zealand
ASP 23		Maize Leaves	New Zealand
ASP 24		Clover Hay	Australia
ASP 51	513	Tasmanian Blackwood Leaves	New Zealand
ASP 52		Beetroot Leaves	New Zealand
ASP 53		Grass Hay	Australia
ASP 54		Barley Grain	New Zealand

2.5 Data analysis and periodic reporting

Laboratory results, after submission to GPL, were entered into a database and independently checked for data transfer accuracy prior to data processing. The non-parametric assessment of laboratory performance for each sample and method was performed by an iterative statistical procedure similar to that used in WEPAL inter-laboratory proficiency programs of Wageningen University. This procedure^{7,8} is suited to datasets of as few as seven laboratories, although larger laboratory populations are best. An outline of the “median / MAD” statistical procedure is provided in Appendix 3, with terms described in Table 3.

In addition to medians and MADs, other statistical parameters (also described in Table 3) were calculated before and following the omission of non-conforming results. The “raw” data submitted by participating laboratories on a test-by-test basis are documented in Appendix 4, sometimes rounded for table formatting purposes.

Results submitted by each laboratory were expected to have three significant figures, unless protocol or common sense dictated otherwise. For example, the program accepted data where it was common to report measured concentrations to the nearest third decimal point, such as 0.001 mg/kg for those trace metals reported in mg/kg, and 0.001 % for Na, while two decimal places were accepted for other tests, rather than to three significant figures. However, the program (like others internationally) did not accept a zero value nor a result reported as less than (<) or greater than (>) a specified number. In cases where the expected value was below the laboratory’s lower limit of reporting, the expectation was that the laboratory would either report the raw concentration readout from the instrument in absolute terms or a value half-way between that value and zero. For high values, dilution was the expected option.

Interim reports for each “round”, summarizing measurement performance relative to the performance of all laboratories that undertook the same test/s, were routinely and quickly emailed to participants. The main purpose of these Interim Reports was to provide timely feedback and to enable laboratories to take prompt remedial action where appropriate. Interim reports also provided an opportunity to correct for any data-transfer and data-processing misinterpretations. In

⁷ Rayment, G.E., Miller, R.O. and Sulaeman, E. (2000). Proficiency testing and other interactive measures to enhance analytical quality in soil and plant laboratories. *Communications in Soil Science and Plant Analysis* 31: 1513-1530.

⁸ Whitehouse, M.W. (1987). Medians and MADs - Statistical methodology used at Wageningen, The Netherlands, for interlaboratory comparisons in the plant exchange program. Ag.Chem. Br. Report, ACU87/36.10 pp. (Qld. Dept. Primary Ind., Brisbane.)

addition, a newsletter from GPL occasionally went to all participating laboratories. Its main purpose was to assist in the interpretation of interim reports. Also included in GPL's newsletter was information about upcoming events and operational administration of the program.

Laboratories that participated in the 2013-14 plant ILPP all received from GPL (on behalf of ASPAC) a laboratory specific, confidential, Annual Summary Report. Each laboratory's data for the 12 plant samples, the aggregate data from all participants, other relevant statistical data, and whether or not the test/s received ASPAC Certification (if applicable), were provided. The laboratory code number was included.

Table 3. Statistical terms and their meanings in the context of this ASPAC annual report

Statistical term	Meaning and/or derivation
Count or number	Original population size.
Maximum i	The highest of a range of values, based on the initial data set.
Minimum i	The lowest of a range of values, based on the initial data set.
Median	The median is the score at the 50 th percentile. It is the middle observation of a sequentially sorted array of numbers, except in the case of an even sample size. Here it is the arithmetic mean of the two observations in the middle of the sorted array of observations. The median of a reasonably sized array of numbers is insensitive to extreme scores.
Mean ^A	The arithmetic mean (or average) is the sum of the values of a variable divided by their number. It represents the point in a distribution of measurements about which the summed deviations equals zero. The arithmetic mean is sensitive to extreme measurements.
MAD	The <u>Median of the Absolute Deviations</u> , calculated as the median of the absolute values of the observations minus their median.
Interquartile range (IQR)	This is calculated by subtracting the score at the 25 th percentile (referred to as the first quartile; Q ₁) from the score at the 75 th percentile (the third quartile; Q ₃). This value is affected by the assumptions made in the calculation of the first and third quartiles, particularly for low population sizes. Moreover, these differences exist within and across statistical software packages. Prior to the 2004-05 rounds, ASPAC used the algorithm employed by EXCEL and some others. From the 2004-05 program, the algorithm employed has been that of SAS Method 4 ⁹ . In summary, IQR = Q ₃ -Q ₁ .
Normalized IQR	This equates to IQR x 0.7413, where the latter is a normalizing factor.
Robust % CV ¹⁰	The robust coefficient of variation (Robust % CV) = (100 x normalised IQR / median). For simplicity, the Robust %CV shown is for the initial results, and also for the “final” population of results for a test after the removal of “outliers” and perhaps “stragglers”, usually following one or two iterations. Note that for Interim Reports, this term is estimated as = (100*MAD*1.483)/ Median, separately for “i” and “f” datasets.
Letter “i” and the letter “f” associated with medians, means, MADs, IQR and Robust %CVs.	The letter “i” relates to the initial data set. The letter “f” relates to the “final” data set, generated after one or two iterations typically after removal of laboratories with statistical “outliers” (if any), and statistical “stragglers” (if any).

A When the mean is greater than the median, the distribution is positively skewed. When the mean is lower than the median, the distribution is negatively skewed.

2.6 ASPAC's criteria for certification of laboratories for plant tests

Subject to satisfactory measurement performance, typically for 12 samples across three sequential “rounds” in a 12-month period, ASPAC awards participating laboratories with a printed, signed and dated *Certificate of Proficiency*. The *Certificate of Proficiency* identifies performance for each test that met criteria set by ASPAC. Certification for a given method / test (not laboratory accreditation) applies when a laboratory incurs no more than four demerit points for the 12 samples.

Demerit points (if any) were allocated through the identification of “outliers” and “stragglers” by the “median / MAD” statistical procedure mentioned earlier in this report. Appendix 3 provides details on how “outliers” and “stragglers” were identified. Two demerit points were allocated to each statistical “outlier”, while a statistical “straggler” was allocated one demerit point. As no sample result could be both an “outlier” and a “straggler”, a maximum of two demerit points is all that could accrue per sample for a specific test.

For any single “round” of four samples, three (3) was set as the maximum number of demerit points for a specific test. This was done so that unsatisfactory measurement for a test in one “round” did not in itself result in failure to be certified for that test across the three “rounds” in the designated 12-month period.

If a “round” was missed, the maximum number of three demerit points for every test in that “round” was allocated, unless very special circumstances applied and was known or advised expeditiously to the ASPAC-LPC through its Convenor. When the explanation was accepted, performance from the three most recently completed “rounds” was used to assess eligibility for certification. There were no “very special circumstances” in 2013-14.

ASPAC’s *Certificates of Proficiency* are only issued on completion of each annual program of three “rounds”. Nowadays, ASPAC provides details of certified laboratories by test on its public web site. Certifications obtained in the 2013-14 Plants’ program remained valid until superseded by findings from the following 2014-15 ILPP.

3. Summary Statistics

This section provides summary information and data (sometimes rounded only for table formatting purposes) on a test-by-test basis (alphabetical) for each of the 12 samples used across three “rounds” in 2013-14. The tabulations include values relevant to the iterative “median / MAD” procedure plus other parametric and robust statistics. For the meaning or derivation of the terms used in the tabulated summaries, see Table 3 and Appendix 3. All data are expressed on a dry weight basis.

4. Comments on Measurement Performance

Full evaluation of measurement performance is beyond the scope of this report. Such evaluations are typically made at ASPAC Workshops and in other national and international fora. It is appropriate, however, to make a few observations.

The grand median robust % CVs across the 12 samples by test in 2013-14, after the removal of “outliers” and “stragglers”, ranged from 1.4 (for C) to 53.0 (for NO₃-N), which is a slightly narrower range than for corresponding tests in 2012-13 but similar to the range for 2011-12. Figure 1 presents, in ascending order, the grand median robust %CVs for the 2013-14 program. Although not identical, there are many similarities with the 2012-13 data with respect to the values for %CVs across the elements.

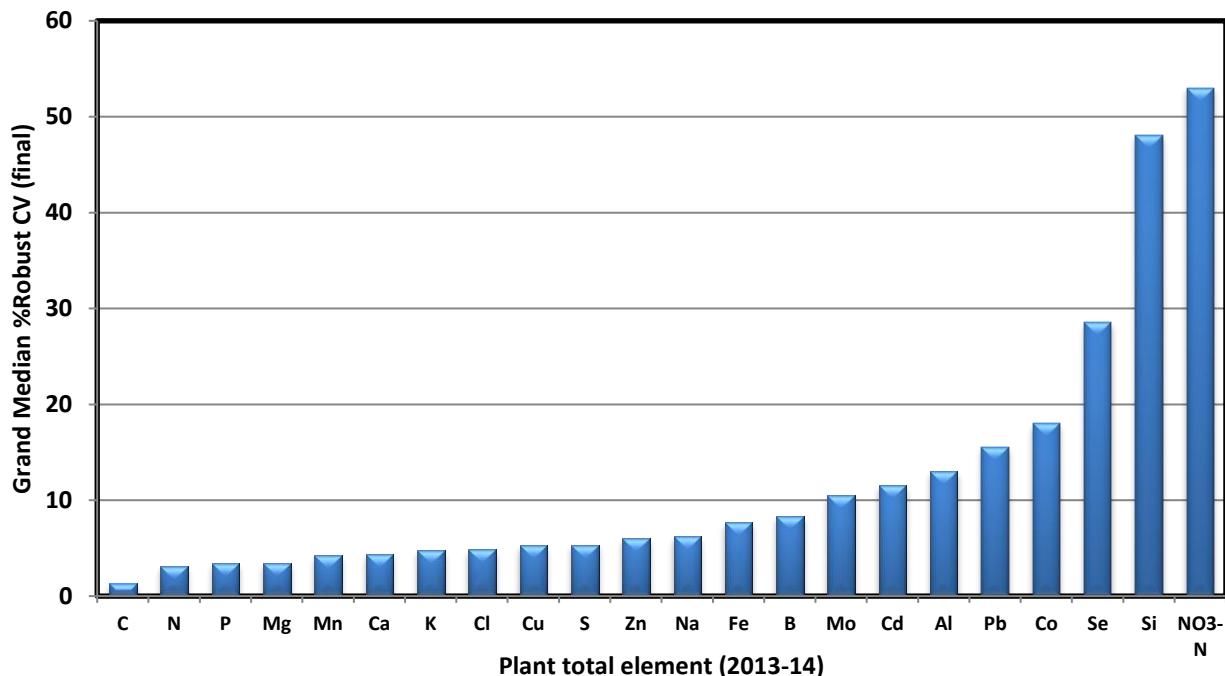

Figure 1. Grand median robust %CVs (final) for the 2013-14 plant-program years (note that Si was not assessed).

Across all 6628 reported plant test results in 2013-14, 14.3% were statistically assessed to be “outliers” (15.0% in 2012-13). The corresponding figure for “stragglers” was 4.4% (4.1% in 2012-13). For individual elements, the range of “outliers”, expressed as percentages of the number of reported results for the particular test, ranged from 6.9% (Al) to 23.1% (Mo), while those for “stragglers” ranged from 1.3% (Si) to 9.8% (NO₃-N) of reported results for the specified test. No trends were seen between either the number of statistical “outliers”, or the number of “stragglers”, and the number of reported results per element.

Grand median robust %CVs across all plant tests (Si excluded) ranged from 5.0% (ASP 41) to 8.5% (ASP 102), with a grand median for the 12 samples of 6.15%, slightly less than was the case in the 2012-13 program. The sequence for the sample with the lowest to the highest grand median %CV (final) was 51, 23, 22=24, 53, 54, 104, 103, 101=52, 21, and 102 (all with the prefix ASP). Interestingly, test-sample ASP 22, which experienced difficulty during homogeneity testing, performed well across all tests. With Si included, the grand median robust CV was 6.5%, while lowest to highest rankings were similar but not identical.

Robust %CV are often influenced by analyte concentrations in predictable ways. For the 2013-14 Plant Program Year, the elements (tests) with robust %CV most influenced by analyte concentrations (highest %CVs at lowest concentrations) were, in decreasing order, Pb, B, Nitrate-N, Al, Na, Co, and Mo. Moreover, power functions describing

these 2013-14 relationships had highly-significant coefficients of determination (analogous to percent variance explained) ranging from 0.83 to 0.50.

And for numbers of outliers and stragglers, there were fair, continuous power-function relations ($r^2 = 0.38$ and 0.29, respectively) with final robust %CVs, indicating that numbers of both outliers and stragglers tended higher when robust %CVs were low. In other words, it was more likely for a laboratory to record an outlier and/or straggler when the between-laboratory variance on a test-by-test basis was low.

Raw data and summary tabulations on the median and ranges of elemental concentration data covered by the 2013-14 program indicate that a reasonably wide range of concentrations applied to most total elements. Exceptions included Mg, and Ca to a lesser extent. Similar assessments also applied to total plant P and S concentrations. In addition, the spread of plant Si concentrations was lower than expected, although this assessment may reflect the presence of acid-soluble results as against true total S.

Appendix 1: List of laboratories (including contact details at the time) who participated in ASPAC's Plant ILPP in 2013-14, arranged by country

* Homogeneity statistics calculated according to:-Thompson, M., Ellison, S.L.R. and Wood, R. (2006). "The International Harmonised Protocol for the Proficiency Testing of Analytical Chemistry Laboratories." *Pure Appl. Chem.* **78**(1): 145-196. IUPAC Tech. Report.

** Sample ASP 22 did not meet homogeneity criteria for Nitrogen. Failed homogeneity using final SD. Reviewing data - 1st pass 0.11901 (outliers removed), 2nd pass 0.07413 (stragglers removed), final pass 0.04448. Passes homogeneity with second pass SD. This sample assumed as homogenous and fit for purpose.

Appendix 3: Statistical procedures used by ASPAC for its contemporary plant ILPP

Refer to Table 3 for a description of most statistical terms and their meaning. Of most significance is the “median / MAD” non-parametric, iterative procedure for identifying “outliers” ($\dagger\dagger$) and “stragglers” (\dagger) within datasets for particular tests and samples from multiple (typically 7 or greater) laboratories. See references in the body of the report for more details. Also, the median (μ) is regarded as a good estimate of the true mean, while the MAD; i.e. the median of the absolute deviations from the median, (@), is regarded as a good estimate of the standard deviation.

After tabulating the data with a separate column for each sample result and a separate row for each laboratory, calculations were applied iteratively. Each iteration operated at an action level of $[(X - \mu)/f@]$ (called the “ASPAC Score” for convenience) >2 , where “X” is the value reported by the laboratory (one replicate assumed), “ μ ” is the median of the population of values, and “f@” is a code for the Gaussian distribution of the sample size “n”, approximated by $[0.7722 + 1.604/n * t]$, with $t =$ the Student’s “t” for 5% (two-tailed) with $n-1$ degrees of freedom]. Excluding any case when a laboratory reported no result (or a non-numeric value) [these were automatically excluded], the laboratories at first iteration with an “ASPAC score” >2 were rated as “outliers” ($\dagger\dagger$). Following their removal (if any), the remaining population of laboratory data were subject to a second iteration involving a recalculation of the “ASPAC score”. When again >2 , the relevant laboratories were rated as “stragglers” (\dagger).

The other statistics summarised in Table 3 were calculated on the same populations of data. Only the first (i) and second (final; f) values appear in the data summaries in Section 3.

Appendix 4: Plant analytical method codes and “Raw” program data for the 12 plant samples across three “rounds” in 2013-14.

The following tabulations of “raw” plant analytical data, as reported by participating laboratories, are listed in approximate alphabetical order by element after removal of unnecessary precision, this following completion of statistical tests. Precision adjustments were performed only to assist “raw” data presentation. Statistical “outliers” and “stragglers” are indicated by †† and †, respectively. All results are understood to be on an oven dry basis. Method Codes listed in the “raw data” tabulations are described in Tables 5 and 6.

Table 5. ASPAC method indicating codes (MIC) to allow laboratories to record the preparation, extraction and/or digestion techniques used for each plant test/element reported in this ILPP. A separate ASPAC Code (see Table 6) is required to identify relevant instrumental and/or analytical finishes.

Preparation / Extraction / Digestion Technique	ASPAC MIC Code
Dry Ashing with HF, and uptake in HCl	AA
Dry Ashing with HF, and uptake in HNO ₃	AB
Dry Ashing with HF, and uptake in H ₂ SO ₄	AC
Dry Ashing without HF, and uptake in HCl	AD
Dry Ashing without HF, and uptake in HNO ₃	AE
Dry Ashing without HF, and uptake in H ₂ SO ₄	AF
Extraction with acid(s)	BA
Extraction with water	BB
Finely-divided dry sample	CA
Microwave digestion - closed system with HF, and final medium H ₂ SO ₄	DA
Microwave digestion - closed system with HF, and final medium HNO ₃ and/or HCl	DB
Microwave digestion - closed system with HF, and final medium HClO ₄	DC
Microwave digestion - closed system without HF, and final medium H ₂ SO ₄	DD
Microwave digestion - closed system without HF, and final medium HNO ₃ and/or HCl	DE
Microwave digestion - closed system without HF, and final medium HClO ₄	DF
Microwave digestion - open system with HF, and final medium H ₂ SO ₄	DG
Microwave digestion - open system with HF, and final medium HNO ₃ and/or HCl	DH
Microwave digestion in open system with HF, and final medium HClO ₄	DI
Microwave digestion - open system with HF, and final medium HNO ₃ / peroxide	DJ
Microwave digestion - open system without HF, and final medium H ₂ SO ₄	DK
Microwave digestion - open system without HF, and final medium HNO ₃ and /or HCl	DL
Microwave digestion - open system without HF, and final medium HClO ₄	DM
Microwave digestion - open system without HF, and final medium HNO ₃ / peroxide	DN
Pellet (fused)	EA
Pellet (pressed powder)	EB
Schoeniger combustion with Pt and O ₂ , with uptake in HCl	FA
Schoeniger combustion with Pt and O ₂ , with uptake in HNO ₃	FB
Wet digestion - open system with H, and final medium H ₂ SO ₄	GA
Wet digestion - open system with HF, and final medium HNO ₃ and /or HCl	GB

Preparation / Extraction / Digestion Technique	ASPAC MIC Code
Wet digestion - open system with HF, and final medium HClO_4	GC
Wet digestion - open system with HF, and final medium HNO_3 / peroxide	GD
Wet digestion - open system without HF, and final medium H_2SO_4 (includes Kjeldahl – not quantitative for NO_3)	GE
Wet digestion - open system without HF, and final medium H_2SO_4 (includes Kjeldahl – quantitative for NO_3)	GF
Wet digestion - open system without HF, and final medium HNO_3 and /or HCl	GG
Wet digestion - open system without HF, and final medium HClO_4	GH
Wet digestion - open system without HF, and final medium HNO_3 / peroxide	GI
Wet digestion - open system without HF — diacid (HNO_3 , HClO_4)	GJ
Wet digestion - open system without HF — triacid (HNO_3 , H_2SO_4 , HClO_4)	GK
Others	ZZ

Table 6. ASPAC's method indicating codes for instrumental and/or analytical finishes (IA-MIC) to allow laboratories to record the instrumental and/or analytical finishes associated with each plant test/element reported in this ILPP. A separate ASPAC Code (see Table 5) is required to identify relevant preparation/extraction/digestion techniques.

Instrumental and/or analytical finish	ASPAC IA-MIC Code
AAS-ETA: [Atomic Absorption Spectrophotometry Electro-Thermal Atomisation] background correction, without chemical modifier	01
AAS-ETA with deuterium background correction, without chemical modifier	02
AAS-ETA with Zeeman background correction, without chemical modifier	03
AAS-ETA with pulsed hollow cathode lamp background correction, without chemical modifier	04
AAS-ETA without background correction, with chemical modifier	05
AAS-ETA with deuterium background correction, with chemical modifier	06
AAS-ETA with Zeeman background correction, with chemical modifier	07
AAS-ETA with pulsed hollow cathode lamp background correction, with chemical modifier	08
AAS-Flame, without background correction, using air-acetylene	09
ASS – carbon rod –graphite furnace	10
AAS-Flame with deuterium background correction, using air-acetylene	11
AAS-Flame with Zeeman background correction, using air-acetylene	12
AAS-Flame with pulsed hollow cathode lamp background correction, using air-acetylene	13
AAS-Flame without background correction, using N_2O -acetylene	14
AAS-Flame with deuterium background correction, using N_2O -acetylene	15
AAS-Flame with Zeeman background correction, using N_2O -acetylene	16
AAS-Flame with pulsed hollow cathode lamp background correction, using N_2O -acetylene	17
Chromatography	18
Cold vapour technology	19
Flame emission	20
Gravimetric	21
Hydride technology and similar	22

Instrumental and/or analytical finish	ASPAC IA-MIC Code
ICP-AES	23
ICP-MS	24
Infrared — near-range (NIR)	25
Infrared — mid-range (MIR)	26
Ion selective electrode	27
Ion chromatography	28
Neutron activation analysis	29
Spectrophotometry (manual)	30
Spectrophotometry (auto; segmented flow, FIA, DA, etc.)	31
Titrimetric	32
Turbidimetric / or Nephelometric	33
Voltammetry (direct)	34
Voltammetry (stripping)	35
X-ray fluorescence	36
Dumas (e.g. Leco)	37
